VIiTimber

Changing the Firewood Industry

Company Profile 2026

OUR MISSION

To bring warmth and coziness to every home.

INNOVATION

Vli Timber operates the world’s largest and most efficient firewood production facility. Our team designs and builds unique production equipment unmatched in the industry.

OUR VISION

To become Europe’s largest and most innovative firewood producer.

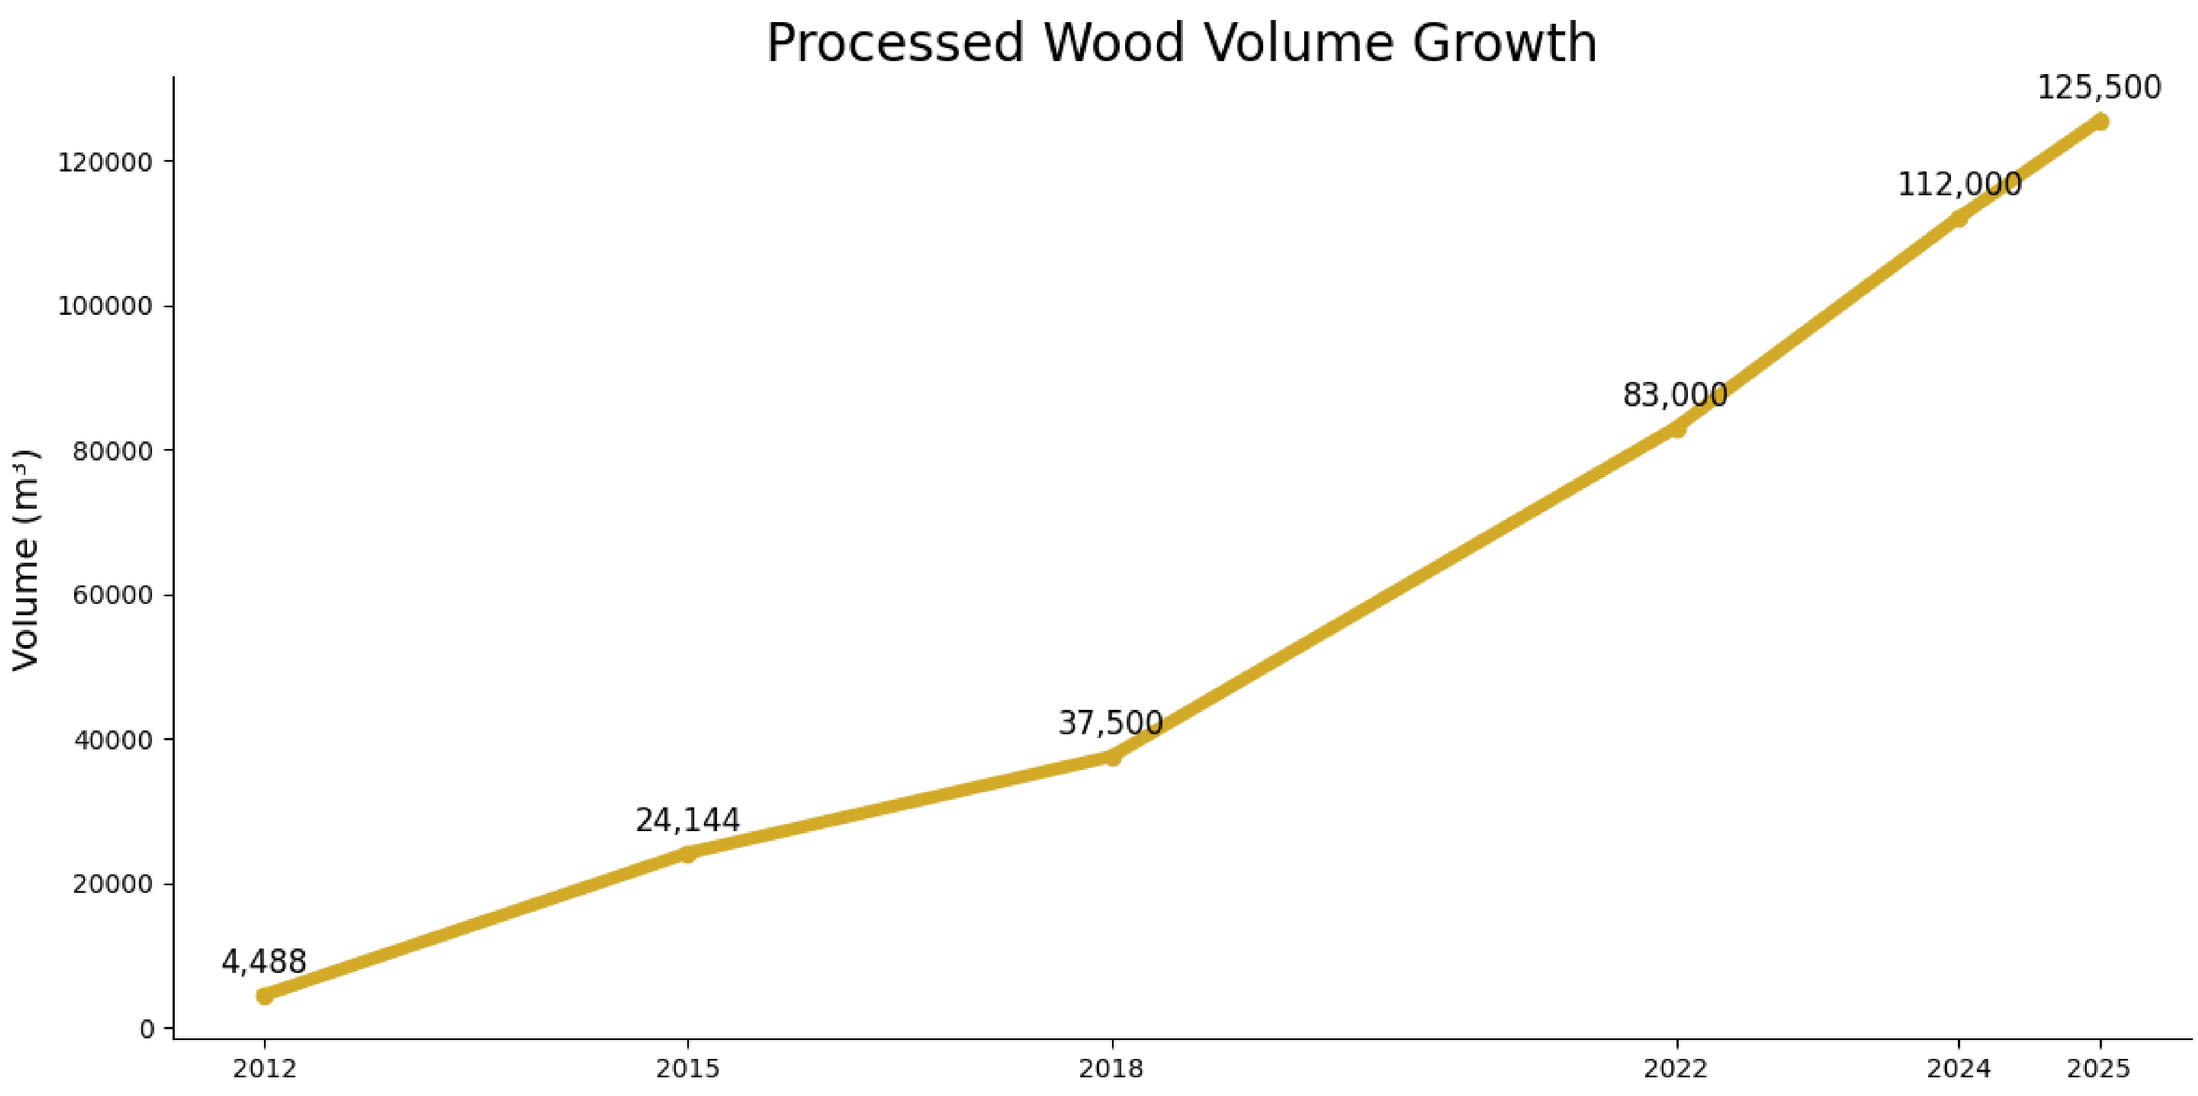

STRATEGIC FOCUS

Since 2009, we have focused on one industry, aiming to be the best in the world by a wide margin.

UAB Vli Timber is the **largest producer of kiln-dried firewood in Europe***, operating since 2009. The Company specializes in the **production of kiln-dried firewood** in small packaging formats. Its products are sold across major European retail chains, both directly and through distributors (including LIDL, ALDI, Gamma, Hagebau, TOOM/REWE, B&Q, and others).

Our operations are built around three priorities: efficient production, consistent product quality, and reliable long-term partnerships. With more than 125,500 m^3 of wood processed annually, Vli Timber serves over 170 business clients across more than 10 export markets.

We continue to invest in proprietary technology, production capacity, and export development to support stable, long-term growth.

New Venice Firewood Factory

Vli Timber is developing the Venice firewood factory in Venecija village, Jonava District, Lithuania. This fully automated kiln-dried firewood production facility is a central part of the company's long-term capacity and export growth strategy.

The factory will be built on an approximately 20-hectare site, with around 7,000 m^2 of production and operational buildings. It will integrate automated sorting, cutting, splitting, drying, handling, and packaging within a single production system.

One Integrated Production System

From incoming timber to retail-ready packaging

Sensor-based monitoring and data-driven process control will support consistent moisture levels, greater energy efficiency, and reliable year-round quality. By converting low-grade timber into value-added kiln-dried firewood, the factory will also improve resource efficiency and production scalability.

Architectural visualisation

Processed Low-grade Timber Volumes (m³)

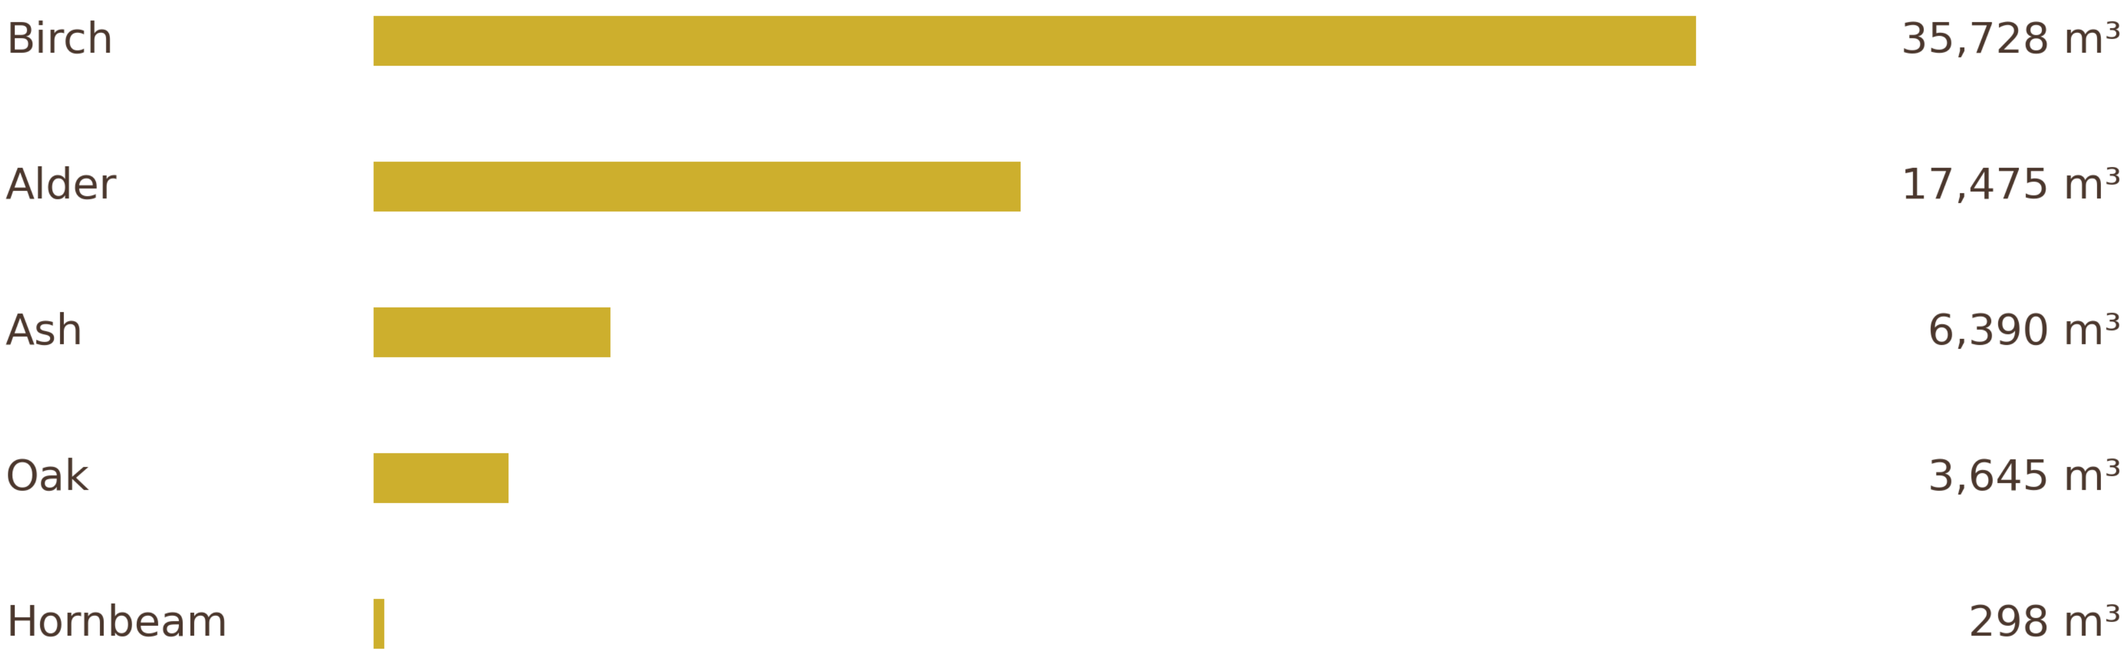

> In the first half of 2026, we processed 63,535 m³ of low-grade timber, 2.5% more than during the same period in 2025. Demand already exceeds our current production capacity, and the facility operated effectively at full capacity throughout the period. Investments in automated splitting and modernised kilns helped us increase output within the limits of our existing infrastructure. The next major step will be the new Venecija facility, designed to deliver greater scale, automation, and energy efficiency.

– Darius Lackus, CEO
